

Smallholder farmers across Sub-Saharan Africa often face urgent problems like a diseased crop, a nutrient deficiency, a pest outbreak, but they struggle to access accurate, timely advice, since existing knowledge is scattered and hard to search, and generic tools often return information that looks relevant but is actually wrong. This can lead to lost harvests and reduced income for families who depend on these farms to survive. Our project builds a retrieval system that ranks agricultural extension advice to surface the most accurate, expert-verified guidance for a farmer's specific question, distinguishing correct answers from similar-looking but incorrect ones. Our solution is guided by accuracy, accessibility, and trustworthiness, since farmers make real decisions based on this guidance. We hope this system helps farmers get reliable answers when they need them most; turning existing expert knowledge into something genuinely usable, not just technically impressive.
